# Exam 2

## Data Science for Studying Language & the Mind

#### Instructions

The exam is worth 113 points. You have 1 hour and 30 minutes to complete the exam.

- The exam is closed book/note/computer/phone except for the provided reference sheets
- If you need to use the restroom, leave your exam and phone with the TAs
- If you finish early, you may turn in your exam and leave early

### (5 points) Preliminary questions

Please complete these questions before the exam begins.

(a)	(1 point) What is your full name?
(b)	(1 point) What is your penn ID number?
(c)	(1 point) What is your lab section TA's name?
(d)	(1 point) Who is sitting to your left?
(e)	(1 point) Who is sitting to your right?

# 1. (24 points) True or false

(a)	(2 points) gories.	The goal of a regression model is to classify observations into distinct cate-
	$\square$ True $\square$ False	
(b)	(2 points)	Model specification involves defining the functional form of the model.
	$\square$ True $\square$ False	
(c)	(2 points)	The equation $y = ax + b$ expresses y as a weighted sum of inputs.
	$\square$ True $\square$ False	
(d)	(2 points) vised.	Regression is a type of supervised learning, while classification is unsuper-
	$\square$ True $\square$ False	
(e)	(2 points) eter space.	In gradient descent, we search through all possible parameters in the param-
	$\square$ True $\square$ False	
(f)	(2 points) algorithm.	The ordinary least squares solution is an example of an iterative optimization
	$\square$ True $\square$ False	
(g)	(2 points) value.	Adding more predictors to a regression model will always increase the $\mathbb{R}^2$
	$\square$ True $\square$ False	
(h)	(2 points) values.	An overfit model performs poorly on both the sample and predicting new
	□ True □ False	

(i)	(2 points)	A reliable model will always be a highly accurate model.
	$\square$ True $\square$ False	
(j)	(2 points) our sample	The error bars on our parameter estimates will become smaller as we increase size.
	$\square$ True $\square$ False	
(k)	(2 points)	Support vector machines can be used for classification problems.
	$\square$ True $\square$ False	
(l)	(2 points)	The logistic function always produces outputs between 0 and 1.
	□ True □ False	

#### 2. (12 points) Model specification

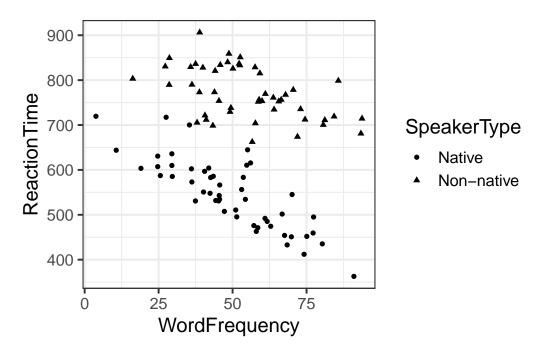

Suppose we measure the reaction times (in milliseconds) of both native and non-native speakers as they process words of varying frequency in English (measured as occurrences per million words). We store these data in a tibble called rt\_by\_speaker. The first 6 rows of this tibble are printed below for your reference.

#### # A tibble: 6 x 3 WordFrequency ReactionTime SpeakerType <dbl> <dbl> <chr> 1 38.8 773. Non-native 2 45.4 754. Non-native 3 81.2 711. Non-native 4 51.4 495. Native 52.6 5 851. Non-native

84.3

6

We've also included an exploratory plot of these data.

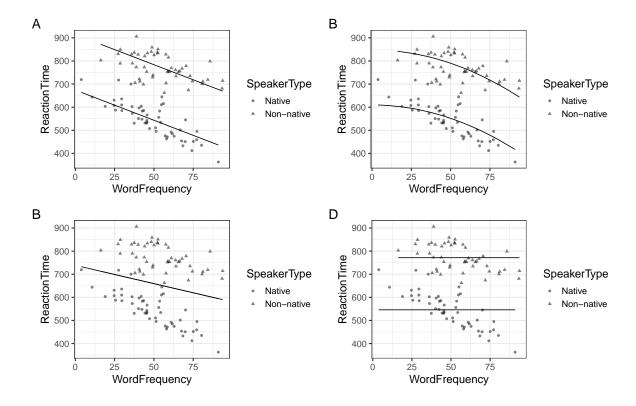

719. Non-native

Suppose we specify the following model with 1m:

```
model <- lm(ReactionTime ~ 1 + WordFrequency + SpeakerType, data = rt_by_speaker)</pre>
```

(a) (3 points) Write the model's specification as a mathematical expression:

- (b) (3 points) For each of the following, circle the option that best describes the type of model we fit.
  - (i) (1 point) Supervised or unsupervised
  - (ii) (1 point) Regression or classification
  - (iii) (1 point) Linear or linearlizable nonlinear
- (c) (3 points) Each of the figures below show a model's predictions for these data plotted with black lines. Circle the figure that is most likely to be the plot of the model spcified to lm? Choose one.

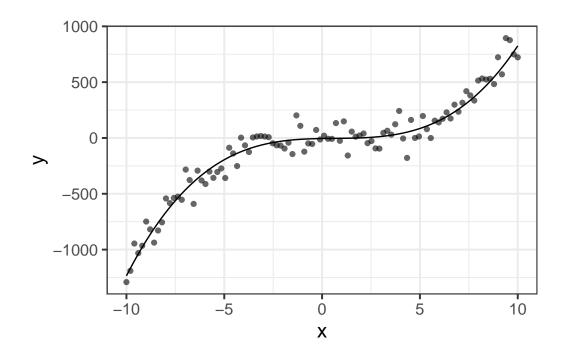

(d)	•	so fit the model with infer, which returns the parameter the following could be the predicted reaction time for a
	Native speaker with a word	frequency of 10?
	# A tibble: 3 x 2	
	term	estimate
	<chr></chr>	<db1></db1>
	1 intercept	674.
	2 WordFrequency	-2.61
	3 SpeakerTypeNon-native	240.
	□ 647.9	
	□ 695.1	
	□ 887.9	
	☐ Not enough information	n to determine this
	37 1 11	
	You may show your work he	ere, if you wish:

### 3. (12 points) Applied model specification

Suppose we encounter the following dataset, glimpsed and plotted here.

Rows: 100 Columns: 2 \$ x <dbl> -10.000000, -9.797980, -9.595960, -9.393939, -9.191919, -8.989899, -~ \$ y <dbl> -1291.0476, -1190.0226, -945.7013, -1031.6017, -965.2677, -748.6480,~

We specify and fit these data with 1m as below:

$$lm(y \sim poly(x, 3), data = data)$$

#### Call:

$$lm(formula = y \sim poly(x, 3), data = data)$$

#### Coefficients:

(Intercept) poly(x, 3)1 poly(x, 3)2 poly(x, 3)3 
$$-63.97$$
 3816.56  $-514.32$  1568.49

(a)	(2 points) What type of polynomial is included in the model specification?	
	Constant Linear Quadratic Cubic Quartic	
(b)	(3 points) Write the <i>fitted model</i> as a mathematical expression:	
(c)	(2 points) In class we learned about two ways to linearlize a nonlinear model. Which option best describes what we have done here?	ch
	$\Box$ Expanding the input space by adding new terms $\Box$ Transforming an existing term	
(d)	(2 points) Given the predicted model (shown with the black line on the figure), who does the model predict for the value of $y$ when $x = 1$ ?	at
(e)	(3 points) Suppose we fit the model specification y ~ poly(x, 100). Explain why th would be an overfit model.	is

#### 4. (13 points) Model fitting

84.3

6

Section 4 refers to the rt\_by\_speaker tibble from section 2. We have returned the first 6 rows of the tibble here for your reference.

#### # A tibble: 6 x 3 WordFrequency ReactionTime SpeakerType <dbl> <dbl> <chr> 1 38.8 773. Non-native 2 45.4 754. Non-native 81.2 711. Non-native 3 495. Native 4 51.4 5 52.6 851. Non-native

Suppose we estimate the free parameters with optimg and lm, which return the following results:

719. Non-native

```
optimg(data = rt_by_speaker, par = c(0,0,0), fn=SSE, method = "STGD")
$par
[1] 674.046758 -2.612294 240.353670
$value
[1] 244250.2
$counts
[1] 24
$convergence
Γ1] 0
lm(ReactionTime ~ 1 + WordFrequency + SpeakerType, data = rt_by_speaker)
Call:
lm(formula = ReactionTime ~ 1 + WordFrequency + SpeakerType,
    data = rt_by_speaker)
Coefficients:
          (Intercept)
                               WordFrequency SpeakerTypeNon-native
              674.052
                                      -2.613
                                                             240.361
```

(a) (2 points) Explain why optimg and 1m return slightly different parameter estimates?

(b) (2 points) What is the cost function used by optimg? Choose one.

 $\square$  SSE

 $\square$  STGD

☐ Gradient descent

 $\square R^2$ 

 $\square$  Not enough information to determine this

(c) (2 points) How many steps did our iterative optimization algorithm take?

(d) (2 points) What was the sum of squared error of the optimal parameters according to optimg? Choose one.

 $\square$  24

 $\Box$  0

 $\square 244250.2$ 

 $\square 244250.2^2$ 

 $\square$  Not enough information to determine this

(e) (2 points) Which approach does 1m use to estimate the free parameters? Choose one.

 $\Box$  Ordinary least-squares solution

☐ Gradient descent

 $\Box$  Another iterative optimization algorith

 $\square$  All of the above

(f) (3 points) Given the model specified in the code to lm, fill in the missing values for the first 6 rows of the input matrix X.

 $\begin{bmatrix} 773 \\ 754 \\ 711 \\ 495 \\ 851 \\ 719 \end{bmatrix} = \begin{bmatrix} 1 & 38.8 & & & \\ 1 & 45.4 & & & \\ 1 & 81.2 & & & \\ 1 & 51.4 & & & \\ 1 & 52.6 & & & \\ 1 & 84.3 & & & \\ \end{bmatrix} \begin{bmatrix} w_1 \\ w_2 \end{bmatrix} + \begin{bmatrix} \epsilon_1 \\ \epsilon_2 \\ \epsilon_3 \\ \epsilon_4 \\ \epsilon_5 \end{bmatrix}$ 

#### 5. (12 points) Model accuracy

Suppose we want to determine how accurate our model is for the rt\_by\_speaker dataset. Section 5 refers to the following code and output.

First we specify and fit our model with 1m and return the model summary.

```
model <- lm(ReactionTime ~ 1 + WordFrequency + SpeakerType, data = rt_by_speaker)
summary(model)</pre>
```

#### Call:

```
lm(formula = ReactionTime ~ 1 + WordFrequency + SpeakerType,
    data = rt_by_speaker)
```

#### Residuals:

```
Min 1Q Median 3Q Max -109.805 -31.329 -2.827 26.158 118.645
```

#### Coefficients:

```
Estimate Std. Error t value Pr(>|t|)
(Intercept) 674.0520 15.4094 43.743 < 2e-16 ***
WordFrequency -2.6125 0.2796 -9.342 3.53e-15 ***

                                  10 0.0300 Preprocessor1_Model1
 (a) (2 points) What is the R^2 value for our original sample?
 (b) (2 points) What is the R^2 estimate for the population?
 (c) (2 points) What kind of cross-validation did we perform? Choose one.
       \square k-fold
       \square boostrapping
       \square leave-one out
       \square Not enough information to determine this
```

(a)	(2 points) How many splits of our data does our code generate?
	<ul> <li>□ 1000</li> <li>□ 100</li> <li>□ 10</li> <li>□ Not enough information to determine this</li> </ul>
(e)	(3 points) Explain the 3-step process that applies to all types of cross-validation.

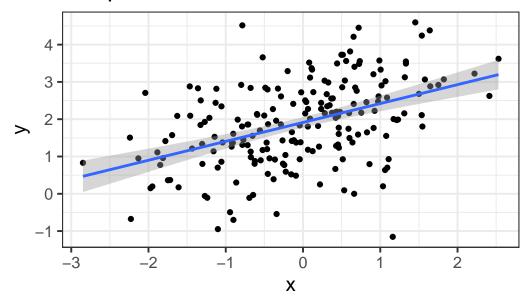

## 6. (12 points) Model reliability

Section 6 refers to two datasets: data\_n10 and data\_n200 which have 10 and 200 observations respectively. Here we plot the data and the fitted model  $y \sim 1 + x$  for each dataset.

# sample size = 200

Here we return the model summary for each.

# Call:

lm(formula = y ~ x, data = data\_n10)

#### Residuals:

Min 1Q Median 3Q Max -1.8557 -0.6285 -0.0113 0.6370 1.5624

#### Coefficients:

Estimate Std. Error t value Pr(>|t|)

(Intercept) 1.7548 0.3740 4.692 0.00156 \*\* x 0.7333 0.2862 2.562 0.03352 \*

---

Residual standard error: 1.138 on 8 degrees of freedom Multiple R-squared: 0.4508, Adjusted R-squared: 0.3821

F-statistic: 6.566 on 1 and 8 DF, p-value: 0.03352

#### Call:

lm(formula = y ~ x, data = data\_n200)

#### Residuals:

Min 1Q Median 3Q Max -3.6565 -0.6757 0.0689 0.6032 3.0019

#### Coefficients:

Estimate Std. Error t value Pr(>|t|)

(Intercept) 1.91308 0.07233 26.448 < 2e-16 \*\*\* x 0.50704 0.07236 7.007 3.72e-11 \*\*\*

\_\_\_

Signif. codes: 0 '\*\*\*' 0.001 '\*\*' 0.01 '\*' 0.05 '.' 0.1 ' ' 1

Residual standard error: 1.021 on 198 degrees of freedom Multiple R-squared: 0.1987, Adjusted R-squared: 0.1947 F-statistic: 49.1 on 1 and 198 DF, p-value: 3.724e-11

(a)	(2 points) Which model is more accurate? Choose one.
	<ul> <li>□ The model fitted to data_n10</li> <li>□ The model fitted to data_n200</li> <li>□ Both models are equally accurate</li> <li>□ Not enough information to determine this</li> </ul>
(b)	(2 points) Which model is more reliable? Choose one.
	<ul> <li>□ The model fitted to data_n10</li> <li>□ The model fitted to data_n200</li> <li>□ Both models are equally reliable</li> <li>□ Not enough information to determine this</li> </ul>
(c)	(2 points) Which value in the model summary quantifies the model's reliability?
	□ Multiple R-squared $□$ Adjusted R-squared $□$ Estimate $□$ Std. Error $□$ Pr(> t )
(d)	(3 points) Suppose we bootstrap a $95\%$ confidence interval for our parameter estimates for the data_n10 dataset. What would happen if we changed the level of the confidence interval to $68\%$ ? Choose one.
	<ul> <li>□ It would get smaller (narrower)</li> <li>□ It would get bigger (wider)</li> <li>□ It would stay the same</li> </ul>
(e)	(3 points) Explain why there is uncertainy on our model parameter estimates.

#### 7. (13 points) Classification

Suppose we want to predict the Fruit\_Type (0 = apple, 1 = banana) based on its Weight, Color (1 = red, 2 = yellow, 3 = green), and Diameter. Our data is stored in the tibble fruit\_data, glimpsed below.

We fit this model with glm and return the following output:

```
glm(Fruit_Type ~ Weight + Color + Diameter, family = "binomial", data = fruit_data)
```

```
Call: glm(formula = Fruit_Type ~ Weight + Color + Diameter, family = "binomial",
    data = fruit_data)
```

#### Coefficients:

```
(Intercept) Weight Color Diameter -2.994585 0.001124 -0.005461 0.101965
```

Degrees of Freedom: 999 Total (i.e. Null); 996 Residual

Null Deviance: 1093

Residual Deviance: 1034 AIC: 1042

(a)	(3 points) For each of the following, circle the option that best describes the type of model we fit.
	<ul> <li>(i) (1 point) Supervised or unsupervised</li> <li>(ii) (1 point) Regression or classification</li> <li>(iii) (1 point) Linear or linearlizable nonlinear</li> </ul>
(b)	(2 points) How many free parameters is this model estimating?
	□ 1 □ 2 □ 3 □ 4 □ Not enough information to determine this
(c)	(2 points) Which of the following parsnip specifications could specify and fit a general ized linear model?
	☐ linear_reg() %>% set_engine("lm") ☐ logistic_reg() %>% set_enging("glm") ☐ Both work
(d)	(2 points) Which of the following expresses the link function for the glm we fit?
(e)	(2 points) What do we call the type of classification we performed via our glm?
	☐ linear regression ☐ logistic regression ☐ nearest-prototype regression ☐ support vector machine
(f)	(2 points) What accuracy metric is best applied to classification models?
	$□$ $R^2$ $□$ RMSE - root mean squared error $□$ Percent correct $□$ Adjusted $R^2$
